

Background

01

The Problem

Online shopping is fragmented, and many SMEs lack the resources to deliver intelligent, seamless commerce and payments.

02

The Opportunity

AI agents can unite product discovery, decision-making, and payment in one conversational journey.

03

Visa's Role

Visa can power secure transactions - enabling commerce using AI agents to deliver end-to-end commerce.

Problem Statement

Conversational Commerce Agents

How might we enable small to mid sized merchants to deploy **pre-built, category-trained AI commerce agents** on their platforms, with no code, so customers **discover, decide, and complete a purchase** without leaving the chat – powered by Visa's Payments Stack?

Expected Submission

01 AI Agent Layer

- Chatbot or voice assistant trained for one category (food, fashion, electronics, travel, etc.)
- Handles discovery, recommendations, comparison, and purchase decision

02 Merchant access

- No-code/low-code way for merchants to go live (upload catalog, connect APIs)
- Works for both a single-location SME and a multi-location retailer

03 Seamless payment

- Simulated Visa payment flow
- Checkout completes inside the conversation, no redirects

04 Trust, Consent and Transparency

- Show how users authorize agent-driven actions (e.g., confirming purchases)
- Include safeguards: transaction previews, identity verification, confirmation before agent transacts

Judging Rubrics

01

Innovation

Novelty of the agentic commerce experience

02

User Experience

Simplicity and intuitiveness of the conversation flow

03

Technical Feasibility

Realistic integration of AI + payment concepts

04

Scalability

Applicability across merchants of different sizes

05

Trust and Safety

Clear handling of consent, security and transparency
